# Discipline > Success

To be a successful trader you need an edge!

Most likely your trading plan already includes a routine that helps you select, construct and evaluate your trades. This guide will go through a set of strategies that are considered as a part of every successful trading plan.

- 
1. How you select your trades.
  2. How you construct your trades.
  3. How you evaluate your performance.

Our goal is to create a systematic approach that leads to consistent trades. You want to get to a point where even if a trade was a losing trade, you would still be happy with your selection and given the same circumstances you would make the same decision again and again.

## **Successful traders are like athletes.**

Successful traders approach trading much like an elite athlete approaches a competition.

Imagine for a moment that you are an elite swimmer preparing for the Australian swimming qualifiers for the Olympics.

You have a lot riding on your performance, so you devise a daily plan. You decide what to do every time you hit the pool; what you will eat and how much you will rest.

Finally, you determine a way to measure your progress. You hit the pool at 4:30am every day. You follow a number of specific drills. Your coach records videos, times & distances. Once out of the pool, you have a healthy breakfast and meet up with your coach to review all the data gathered from the session and review your swimming technique.

After detailed study of the data you will have a better idea of what you are doing well and what you need to change. You incorporate this to your overall plan and you are ready for the next session.

Trading isn't much different except that you can probably trade for much longer than you can competitively swim. All good trading plans operate like a routine. If you want to be prepared for the trading day then you need a routine.

# 1. Selecting what you trade

Many traders will swear by their fundamental or technical analysis. Below is an approach using fundamental and technical techniques. Know the A,B,C of the ideal trade.

A.  
The big picture  
*The Macro events*

B.  
Specific  
*The Micro events*

C.  
Know other traders  
*Psychology of trading*

# A. The big picture

## *The Macro events*

Start with an overview of what is going on around the world. Look at any major events. Look at overseas charts, identify trends and consider reactions to major events.

We suggest you bookmark some of the websites below for further market colour.

- <http://www.thestreet.com/>
- <http://hotcopper.com.au/>
- [www.zerohedge.com](http://www.zerohedge.com)

- [www.thereformrfbroker.com](http://www.thereformrfbroker.com)
- <http://brontecapital.blogspot.com.au/>

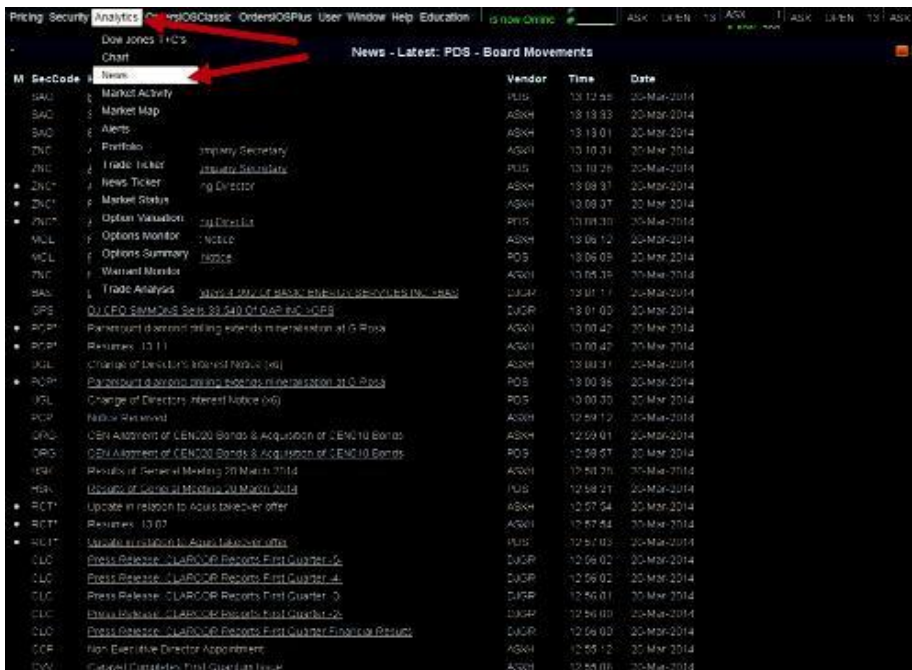

### **Idea:**

FP Markets sends clients a Morning Report with a summary of overseas markets.

**Illustrative Example:** David uses CFD's to get exposure to ASX stocks and SPI futures contracts. David also trades AUD:USD. Given that he is trading CFDs based on the ASX market he pays particular attention to how the US Market traded overnight. David notes down all the major announcements and considers the reaction these announcements will have on the ASX & the Aussie dollar.

It is then time to narrow in on the local market. Create a timetable of major announcements and economic data that is likely to affect the market. This should include:

- Earnings
- AGM's
- Corporate Actions
- Fresh News
- Economic Announcements

| M | SecCode | Item   | Vendor | Time     | Date        |
|---|---------|--|--------|----------|-------------|

### Idea:

News can be found easily on FP Markets IRESS Trader platform by clicking on the analytics tab and selecting 'news.'

*Access the most up to date news through the IRESS Trader platform*

Now that you have a solid understanding of global and local markets, it is time to anticipate various reactions.

Start by drawing scenarios of any events that could translate into price action.

**Illustrative Example:** David knows that the Reserve Bank of Australia (RBA) is meeting to review the interest rate. In preparation he has prepared a table of scenarios that he believes will translate into price action.

| Scenario                | Market Reaction   | Trades   |
|-------------------------|---|--|
| <b>Decrease rates</b>   | This highly unlikely scenario (by market expectations) would trigger a sharp market reaction. The decision indicates that the RBA is not worried about inflation. Lower rates would most likely see a sharp drop in the Australian Dollar, a rally in stocks, and a rally in bond/bill prices.. | <ul style="list-style-type: none"> <li>• Sell AUD.</li> <li>• Buy SPI CFDs.</li> <li>• Buy equity CFDs.</li> </ul>   |
| <b>Steady Rates</b>     | A signal that the RBA believes inflationary pressures are not as great as previously thought.   | <ul style="list-style-type: none"> <li>• Sell AUD.</li> <li>• Buy SPI CFDs.</li> <li>• Buy equity CFDs</li> </ul>  |
| <b>Increase by 0.25</b> | This is the most likely scenario (by market expectations) and may not result in a large reaction unless prices have been moving heavily leading to the announcement. If there is heavy movement then there could be an opportunity to trade the move  | Wait for the reaction.<br>Trade an immediate breakout or wait for a delayed breakout.  |
| <b>Increase by 0.50</b> | We could see a selling opportunity if the AUD has been pushed up strongly in anticipation to the release. If we haven't seen a strong push to the AUD then we could see a rally in the AUD and weakness in bonds and stocks.  | Wait for reaction.<br>Most likely we can: <ul style="list-style-type: none"> <li>• Buy the AUD</li> <li>• Sell SPI CFDs</li> <li>• Sell equity CFDs</li> </ul> |
| <b>Increase by 0.75</b> | This unlikely scenario (by market expectations) would trigger a sharp market reaction. This would signal that the RBA is concerned about inflation levels.  | <ul style="list-style-type: none"> <li>• Sell AUD.</li> <li>• Buy SPI CFDs</li> <li>• Buy equity CFDs</li> </ul>   |

**Illustrative Example:** The RBA keeps interest rates steady. David quickly sells his AudUSD position and buys a CFD on the SPI futures contract. He now looks for opportunities on the ASX to enter into long Equity CFD positions

## B. Product specific

### *The Micro events*

You should now have a look at the products (such as shares on ASX or forex products) that are likely to receive attention throughout the trading day. In the event of an RBA announcement we would focus on interest rate sensitive stocks, or companies exposed to currency risk. These stocks will usually have larger price movements and active trends.

It can be helpful to start this process the night before by looking at the biggest movers of the previous session. These stocks often see a follow through on the second day.

### Percentage PROFitable

| SecCode | R | Description          | Last | +/-  | %    | Volume     | Bid  | Ask   |
|---------|---|----------------------|------|------|------|------------|------|-------|
| TSE     | R | Transfield Services  | 95   | 15.5 | 19.5 | 8,164,055  | 95   | 95.5  |
| LYC     | R | Lynas Corporation    | 31   | 2    | 6.9  | 5,964,520  | 30.5 | 31    |
| BSL     | R | BlueScope Steel Ltd  | 625  | 38   | 6.47 | 3,928,811  | 625  | 626   |
| BPT     | R | Beach Energy Limited | 162  | 9.5  | 6.23 | 15,600,876 | 162  | 162.5 |
| ACR     | R | Acrux Limited        | 226  | 13   | 6.1  | 1,437,761  | 226  | 227   |

Click on the Volume icon to arrange CFDs based on various stocks by the volume traded.

You should pay particular attention to any stocks involved in fresh news. These stocks may see large price movements as investors digest the new information and thus, trading CFDs on these stocks may generate profits.

### Idea:

IReSS Trader allows you to drag and drop any underlying security to a new window. you can also right click on the security code and select 'Broadcast' for security-specific information to appear in all windows on your platform.

## Morning Report

The Morning Report is emailed prior to each trading day. It can also be found through the research portal on the FP Markets website

## C. Know other Traders

### *Psychology of trading*

The prices of financial products will move when there is excess demand or supply. For this reason it pays to know what the crowd is doing.

By now you should have a good shortlist of products that you are looking to trade. It is important to compare your shortlist against the following:

- Sector Trends
- Stocks to Watch
- Stock patterns
- Fresh news
- Important support and resistance levels
- Volumes at different levels
- Volumes on the bid and ask prices
- Institutional influence
- Previous trading

It can be useful to spend 10 minutes putting together levels and data that are important for the day. If you do this on charts it is easier to print them and have a graphic

**Illustrative Example:** David notices on the FP Markets Morning Report that ALZ has been raised to outperform vs neutral at Credit Suisse. ALZ was also one of the highest percentage profits the day before. David plots the support and resistance level for ALZ (399, 384).

*David is looking at the ALZ resistance level. With the RBA announcement and positive news he hopes for a breakout above 399.*

There are many strategies to employ during your analysis. Ideally, you want to gather the best information that will help you make decisions based on your trading plan

Remember:

- Arrange the underlying stocks or instruments that meet your criteria in a watch list and focus only on these.
- Try setting price alerts around stocks or currencies that you think have potential but that do not meet your criteria.

## 2. Constructing your trades

By now you should have a good idea of the trade set ups that you think have value.

Construct your trade with three steps:

1. Choose your ideal entry price point and your stop loss level (the point at which the technical picture is invalidated). The difference between the entry point and stop loss level is the risk you hold per unit.
2. The following calculation is used to determine your position size:

$$\begin{aligned}\text{Position Size} &= \text{Risk per trade} / (\text{Entry Price} - \text{StopLoss}) \text{ or; } S_t \\ &= R_t / (P_e - P_{SL})\end{aligned}$$

3. Once you have your position size you determine your target using your Risk/Reward Ratio (Rrr).. You do this by adopting the RRR into the following formula

$$\begin{aligned}\text{Target} &= \text{RRR} \times (\text{Entry Price} - \text{StopLoss}) \text{ or;} \\ TP &= \text{RRR} (P_e - P_{SL}) + P_e\end{aligned}$$

The potential of the trade must be greater than the target for you to make the trade. If the potential is not there then you do not make the trade.

**Illustrative Example:** David knows his RRR is 1:2 and his acceptable risk is \$100 per trade.:

1. David looks at the ALZ chart and wants to capitalise on a breakout above 399. He will enter the trade at 401. The stop loss is placed below the resistance level at 391.
2. His position size uses the calculation above:  
$$\text{Position Size} = \$100 / (\$4.01 - \$3.91) = 1,000$$
3. David's RRR is 1:2 so his ideal target is \$4.21.  
$$\text{Target} = 2 \times (\$4.01 - \$3.91) + \$4.01 = \$4.21$$

If David thinks that this trade does not have the potential to hit \$4.21 then he should not make this

*David uses the chart to plot his ALZ trade.*

### 3. Evaluating your performance

Every good trader will tell you that they have good times and bad times. What makes them ultimately successful is learning what worked and what didn't.

A **Trading Journal** will help you keep track of your trades. Accurate records will lead to accurate assessment.

**Illustrative Example:** David records his ALZ trade in his Trading Journal below.

| Trading Journal |       |        |       |                 |           |             |          |            |             |  |
|-----------------|-------|--------|-------|-----------------|-----------|-------------|----------|------------|-------------|--|
| Enter           | Enter | Enter  | Enter | Enter           | Enter     | Forumula    | Forumula | Enter      | Forumula    |  |
| Date            | Code  | Volume | RRR   | Acceptable risk | Stop-loss | Entry Point | Target   | Exit price | Profit/Loss |  |
| 11/03/2014      | BHP   | 100    | 2.00  | \$ 100          | \$ 35.83  | \$ 36.83    | \$ 38.83 | \$ 38.83   | \$ 200.00   |  |

David records his ALZ Trade. He is doing well.

*It can also be useful to note down how you feel at the time of the trade and how you are expecting it to play out.*

Replicate the charts you produced as part of your trade plan. Mark the support and resistance levels as well as your entry and exit points. Now compare these with your original plan.

If the trade played out as expected you should note this down. If not, why not? You should look back to see whether there were any indicators you missed.

**Illustrative Example:** David compares his new chart with his original chart.

*David's original chart plots his entry price, stop loss and target.*

*By replicating the chart David has a record of whether the trade played out as expected.*

**Calculate your expectancy** and use the information to improve your trading.

Some traders will judge their success on how many times they take away a profit. If your average profit is significantly higher than your average loss then it may not matter that you make more losing trades than profitable ones.

To calculate your expectancy simply use the equation below:

$$\text{Expectancy} = (\text{probability of a profit} * \text{average profit}) - (\text{probability of a loss} * \text{average loss})$$

Your expectancy will be expressed as a number. To put into practice simply multiply your expectancy with your risk per trade.

**Illustrative Example:** David looks at his trading journal and wants to calculate his expectancy. He takes a profit on 30% of his trades. His average profit is 10% and average loss is 3%.

Probability of a profit= 0.3

Average profit= 10

Probability of a loss = 0.7

Average loss= 3

Expectancy = 0.9

David's risk per trade is \$100. To work out his expectancy for a trade that risks \$100 he simply makes the calculation:

$0.9 * \$100 = 90$

Compare the expectancy of your different strategies. You can then reassess the strategies that are not working and prioritise the ones that do.

Take the time to master the approach in this guide. Try applying some of the techniques to past trading- it may explain where you went wrong. Most likely it will lead to a more confident trader with an edge!

## **1 Set a daily stop loss level.**

This is the maximum dollar amount that you are willing to risk in a single day. If you have an account with \$30,000 you may choose to set your daily stop-loss at \$750. In this case your capital would last for about 40 trading days of consecutive losses. Be sure to select a daily stop-loss that allows you room to trade, especially when market volatility is high.

## **2 Set stop losses for every trade.**

It is vital that you do this BEFOre you enter a trade. Once you are in a position the temptation to break your rules is higher.

## **3 Keep stop losses.**

If you are wrong, you are wrong. Take your loss and re-assess. If your trades are informed by your trading plan then you have no reason to adjust a losing trade. Moving stops as you go can lead to disaster.

## **4 Use trailing stops.**

If the market moves your way try adjusting your stops to reflect your initial risk. A trailing stop loss can be set by price steps or percentage through FP Market's IRESS platform. This will allow you to reduce risk as the position runs towards your secondary target.

## **5 Secondary targets (Profit stops)**

If your position moves in your favour you have an opportunity to take part of your position. Use an initial target that equates to the level of risk you have taken. Then set a secondary target with the help of your RRR.

EXAMPLE: Suppose you are long 2,000 NCM CFDs at \$10 with a stop of \$1.00. If the stock starts moving up, take half of your position out for a profit and your stop would be at breakeven or better. Then you can let the rest of your position run towards your secondary target.

## **6 Trade Potential**

Throughout this guide we considered the Risk/Reward Ratio from the stop loss point. You may decide to base the construction of your trade from the potential you see as opposed to the stops. Volatility will be different in each underlying market, so be sure to adjust the distance of your potential profits and stops accordingly.

EXAMPLE: Assume your RRR is 3:1. If you think that a trade has the potential to rise 3 points then it makes sense for you to risk 1 point. If on average you are right on direction 50% of the time and your losses are smaller than your profits, then you can expect to see profits.

## **7 Plan your trade, Trade your plan.**

This is cliché but the most important lesson you can learn.

Example: Imagine you are long BHP CFDs at \$40 and you have set up a profit target at \$45 and a stop loss at \$38. BHP goes up to \$42 but you can tell it is taking a while to perform.

Do you close the trade for a profit of \$2 on your BHP CFDs? It can be tempting, especially if you think that the stock is running out of steam. You took the time to construct a trade with a cool head. Don't let yourself be biased by the heat of the moment.
